

TWENTY DOCUMENTED ANOMALIES, BACKTESTED ON LIVE PRICES

Twenty quant strategies. Not one produced real alpha.

Each one regressed on market, size, momentum, volatility and reversal factors over 692 observations.

37 to 93%

of variance explained by factors

0 of 20

cleared a t-statistic of 2 on alpha

Momentum is not alpha on top of momentum.

Loading on the momentum factor

0.80

t-statistic on its own alpha

-1.75

Variance the factors explain

93%

It loads almost entirely on the factor it is named after and adds nothing measurable beyond it. That is the normal outcome for price-only rules, and a library claiming otherwise would be the suspicious one.

Capacity does not add up.

Each strategy was sized against its own liquidity. Run together they hold 57 names between them, so a stock two strategies both want carries both positions against one day of volume.

SUM OF THE PARTS

\$13.2B

WHAT THE BLEND CARRIES

\$1.5B

88% overlap tax

Sizing each sleeve independently and adding up overstated deployable capital by nearly 9x.

OPEN SOURCE, PUBLIC DATA, NO KEYS

Every backtest answers how good. This one answers how much.

Strategy library

20 documented anomalies, each with its own capacity

Overfitting firewall

run it on pure noise and it returns 97% PBO, the right answer

Joint capacity

what a blend carries once overlapping names share liquidity

Claim auditor

checks an advertised track record for internal contradictions
